

## To Prioritize Science—Key to Success

One summer day several years ago, the respected Comrade **Kim Jong Un** visited a fish pedigree farm.

Being guided around it, he paid close attention to putting all the fish-farming processes on a scientific footing.

At the oxygen-generating plant he was briefed on the fact that the oxygen generator was a fully automated machine operated by an integrated control system. He said with a smile that the problem of oxygen for the farm had been completely solved.

He highly praised the officials and employees and stressed the need to build on the success and develop fish-farming further.

He then said that the key to success was to prioritize science.

The officials fully realized that giving priority to science and technology was an effective way for solving any difficult problems with credit.

Listening to what he had to say, they pledged to give definite priority to science and technology and implement the Party's ennobling intention to provide the people with plenty of tasty fish.
