

Attachment to Our Own Things

One February day in 2017, the respected Comrade **Kim Jong Un** visited a place where new machines developed by the scientists and technicians of the State Academy of Sciences were on display.

What caught his interest was the generating equipment designed to use renewable energy sources.

Looking at a wind-driven generator, he asked how to control its turbine blades.

The question caught the officials off guard, since there were few who had asked about the control method of turbine blades.

His next question was about the materials used in making the blades.

After listening to an official's explanation, he said: When using our indigenous equipment including wind-driven generators and solar panels, our people will feel proud of our own things.

This made the officials fully aware of his ennobling intention: In using renewable energy sources as well, we should work to make cutting-edge scientific research achievements that can proudly be called our own successes, and this will help our people have deep attachment to our own things.

He resumed: Officials in the sector of science and technology, scientists and technicians should be sensitive both to Party policy and global trends. They should firmly equip themselves with our Party's policies and work hard to acquire cutting-edge science and technology.

The officials pledged to keep his words in mind and work faithfully true to his intention.
