To Suit Specific Environment and Conditions

One July day in 2018, respected Comrade **Kim Jong Un** visited the Samjiyon Potato Farina Factory.

He said: Based on the experience of building a standard factory capable of producing potato farina and various other potato products for the first time in our country and its design, similar factories should be built in other potato-producing areas in the northern mountainous regions.

That day he looked round a circulating fluidized bed boiler newly installed in the factory.

After learning about its operation, he spoke highly of the fact that the boiler, built with indigenous designs and technology and the efforts of the factory to suit its conditions, is capable of producing sufficient steam needed for the production lines with less coal.

The officials felt a sense of remorse about their failure to work properly. At the beginning of construction, they, captivated by the mystique of technology, had set up unprofitable facilities, thus causing impediment to production.

Comrade **Kim Jong Un** said: Even if a facility is a modern one based on cutting-edge technologies, it is useless and will cause losses, if it does not suit the conditions and reality of our country.

Listening to what he had to say, the officials realized once again that all the undertakings should be carried out on the principle of self-reliance in accordance with the specific environment and conditions of the country.
